

# Watershed Conservation Potential

This map displays the conservation potentials of watersheds in southern Santa Barbara County evaluated using a multicriteria analysis (MCA) framework. This framework determines the best watersheds for conservation using the parameters: riparian habitat (within 1,000 ft of a stream & NDVI between .2 and .5), viewshed (visibility from at least 2 viewpoints), and developable land (private land, low cost & land slope less than 20%). Each watershed was assigned a score of 1 to 5, from highest to lowest conservation potential.
